

BRANCHING STRATEGY FOR A TEAM OF 10 DEVELOPERS WORKING ON MULTIPLE EMPLOYMEE MANAGEMENT FEATURE, BUGFIXES AND PRODUCTION RELEASES SIMULTANEOUSLY:

My approach to solve this problem would be to have the branch structure in the following format:

PRODUCTION BRANCH
DEVELOPER BRANCH

the production branch will contain the code that will be used for public and actual real world working of the application.

And the developer branch will be accessed by the 10 developers to implement, improve, test new code & features.

From this developer branch, there can be multiple branches that can be created that is:

Developer Branch

Features/{feature-name}

Bugfixes/{bugfix-name or bugfix-id}

Here each developer can just create a branch from the development branch and then push their code into the development branch

This will reduce the number of merge conflicts and each developer will know what feature and changes have been done to the dev branch and can adjust their code accordingly.
